

Premium AGM technology builds a better battery.

In AGM batteries, the plate stacks are compressed when inserted into the battery case. These tightly packed cells provide maximum support against damage due to vibration to provide superior vibration resistance. This compression also provides superior active material integrity resulting in maximum cycle life. The AGM separator materials lower the internal resistance so these batteries have faster recharging rates and higher amperage than other battery technologies.

Polypropylene cover and container:
for impact and chemical resistance in the tough Powersports environment.

Flame Arrestor:
in venting system, relieves the possibility of sparks entering the battery.

Through the partition construction:
provides efficient current transfer for maximum starting power.

Special grid design:
lead-calcium alloy provides protection from corrosion, vibration and prolongs battery life.

Special Active Material:
provides maximum cranking power and long life.

Advanced Separator Technology:
AGM (Absorbed Glass Mat) batteries utilize a glass mat material between the battery plates that absorbs 100% of the acid, making the battery unspillable.
